ABSTRACT

A pump primarily for liquid paint includes ~~comprising~~ first and second pistons (19, 21) reciprocable rectilinearly in respective first and second cylinders. The (17, 18), ~~said~~ first and second pistons ~~[[being]]~~ are moved relative to their respective pistons by operation of an A. C. electric motor ~~[[13]]~~ the rotary output shaft of which is coupled to ~~[[said]]~~ the first and second pistons by ~~means including~~ a constant velocity cam ~~[[31]]~~ and a cam follower (32, 33)-mechanism converting rotary motion of the output shaft into reciprocatory motion of ~~[[said]]~~ the first and second pistons 180° out of phase with one another.
